

# Using simple(ish) tools for appraising electronic records

Presented by Eira Tansey, Digital Archivist/Records Manager  
University of Cincinnati

# Electronic Records at UC

---

- Born digital vs. digitized
- Records retention schedules
- Transfer of records
- Legal vs ethical exclusion of data

# Sensitive data

---

- Looking at file metadata versus looking inside files
- To accession or not to accession
- Start with these two questions...
  1. What stuff do you have?
  2. What's lurking in the stuff you have?

# Beware the U. Oregon situation

March 26, 2015 by [Nick DeSantis](#)

    Comments (6)

## Archivists Suspended in Records-Leak Case Won't Return to U. of Oregon

Two archivists at the University of Oregon who had been placed on leave after a cache of confidential records was released to a professor will not be returning to their jobs, *The Oregonian* reports.

University officials had described the release of the records as unlawful. A lawyer for [William T. Harbaugh](#), an economics professor who had received the documents, [returned the records](#) to the university in late January. Mr. Harbaugh runs the blog [UOMatters](#) and has been a vocal advocate for transparency by Oregon's administration.

An investigation into the incident found that the records had been released before customary processing had been carried out and that they included information protected under federal and state privacy laws.

# A brief word on appraisal...

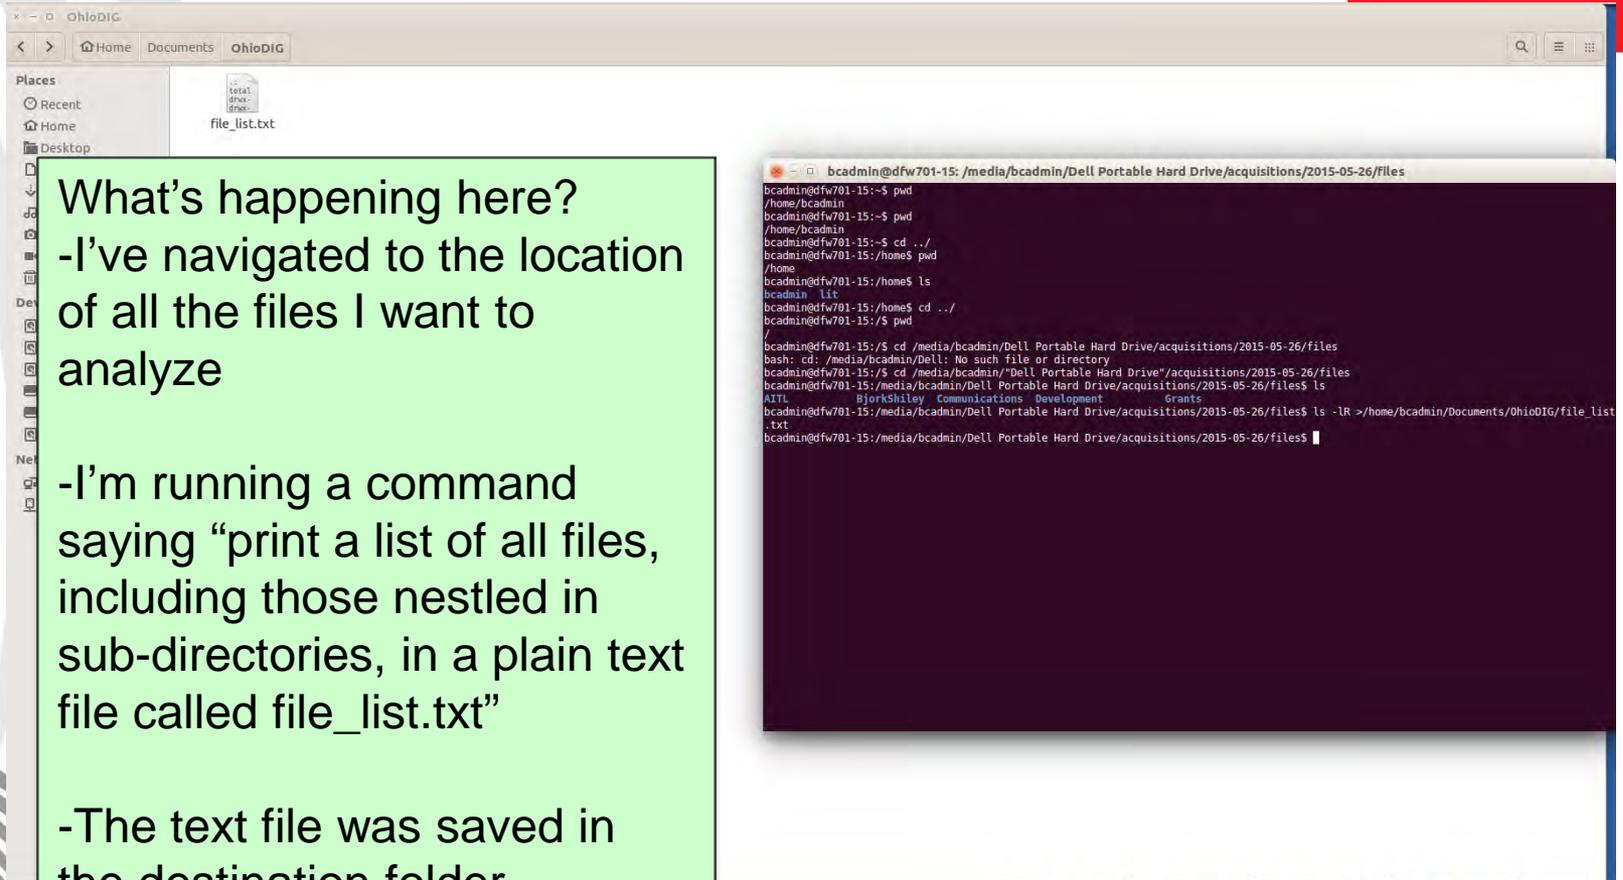

Image via <https://www.flickr.com/photos/denverjeffrey/1950409800/in/photostream/>

# 1. What stuff do you have?

- Imagine files in nests upon nests upon nests... that's too much clicking!
- Use a combination of the command line and simple spreadsheets to get a birds' eye view
- List of file names, extensions, dates, size
- Bertram Lyons' excellent tutorial
  - <http://bit.ly/1ctsgpF>

# Fire up the terminal!

The image shows a Linux desktop environment. On the left, a file manager window is open, displaying a file named 'file\_list.txt' on the desktop. On the right, a terminal window is open, showing a series of commands and their outputs. The terminal output shows the user navigating through the file system to the directory '/media/bcadmin/Dell Portable Hard Drive/acquisitions/2015-05-26/files' and running the command 'ls -lR >/home/bcadmin/Documents/OhioDIG/file\_list.txt' to generate a recursive listing of files in a text file.

What's happening here?

- I've navigated to the location of all the files I want to analyze
- I'm running a command saying "print a list of all files, including those nestled in sub-directories, in a plain text file called file\_list.txt"
- The text file was saved in the destination folder

# Uh..... Why is this useful?

```
file_list.txt (-/Documents/OhioDIG) - gedit

# Wait, there's more!

If you don't love spreadsheets yet, now's the time to start. If you're already a true believer, do not allow others to spreadsheet-shame you.

We can take the plain text file, and transform it into something that is far more useful for appraisal.

# Cleaning up the file

The column with the numbers represents bytes, so you can determine the GB or MB of your files.

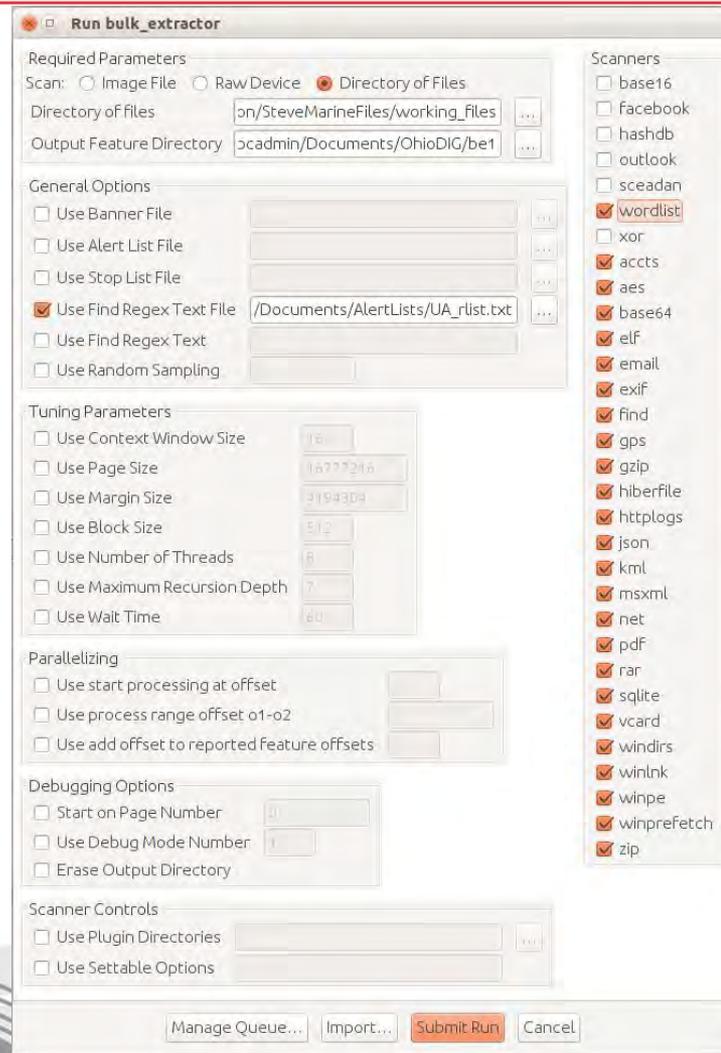

In addition, you can run a function to count the number of unique file extensions

## 2. What's lurking in the stuff you have?

---

- BitCurator is a package of open-source digital forensics tools
- Digital forensics originated in the law enforcement community to deliver legally-admissible digital evidence
- May not want to forensically image everything, but forensics tools can be helpful for other tasks

# Diving Inside with Bulk Extractor

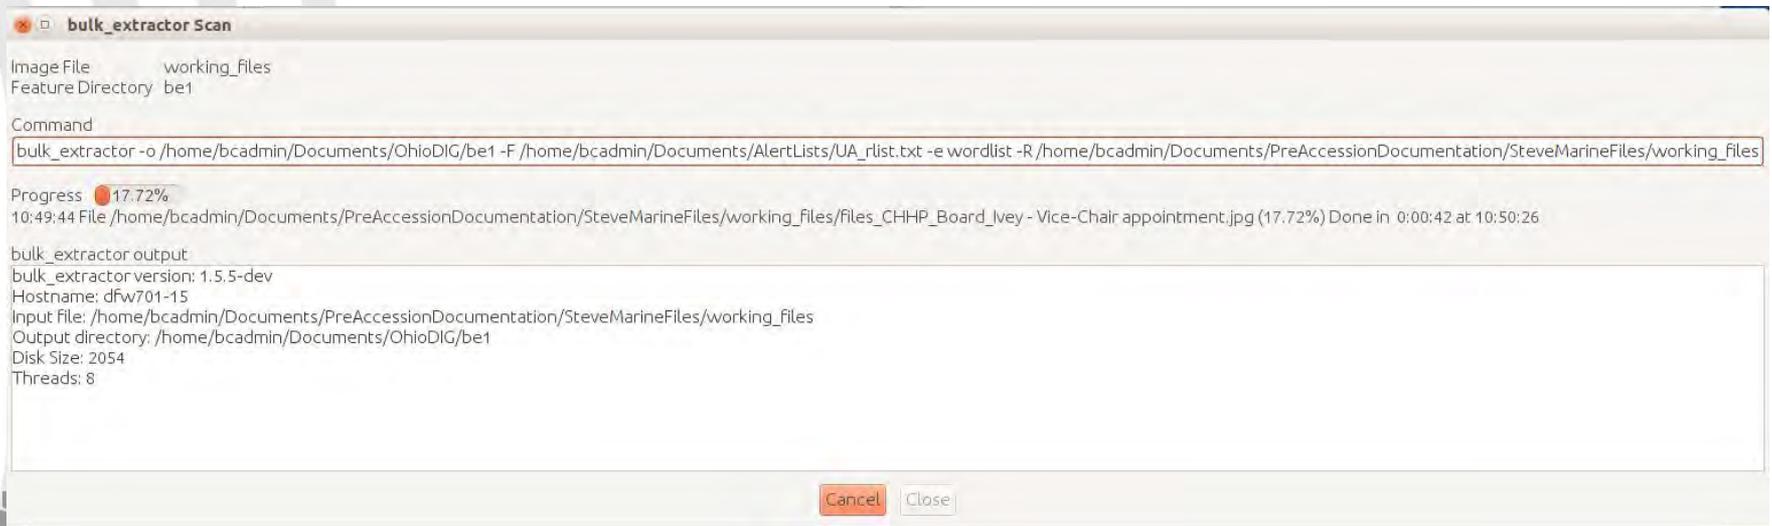

What's happening here?

-The top box is where you point BE to the origin set of files (or forensic disk image) and designate an output destination

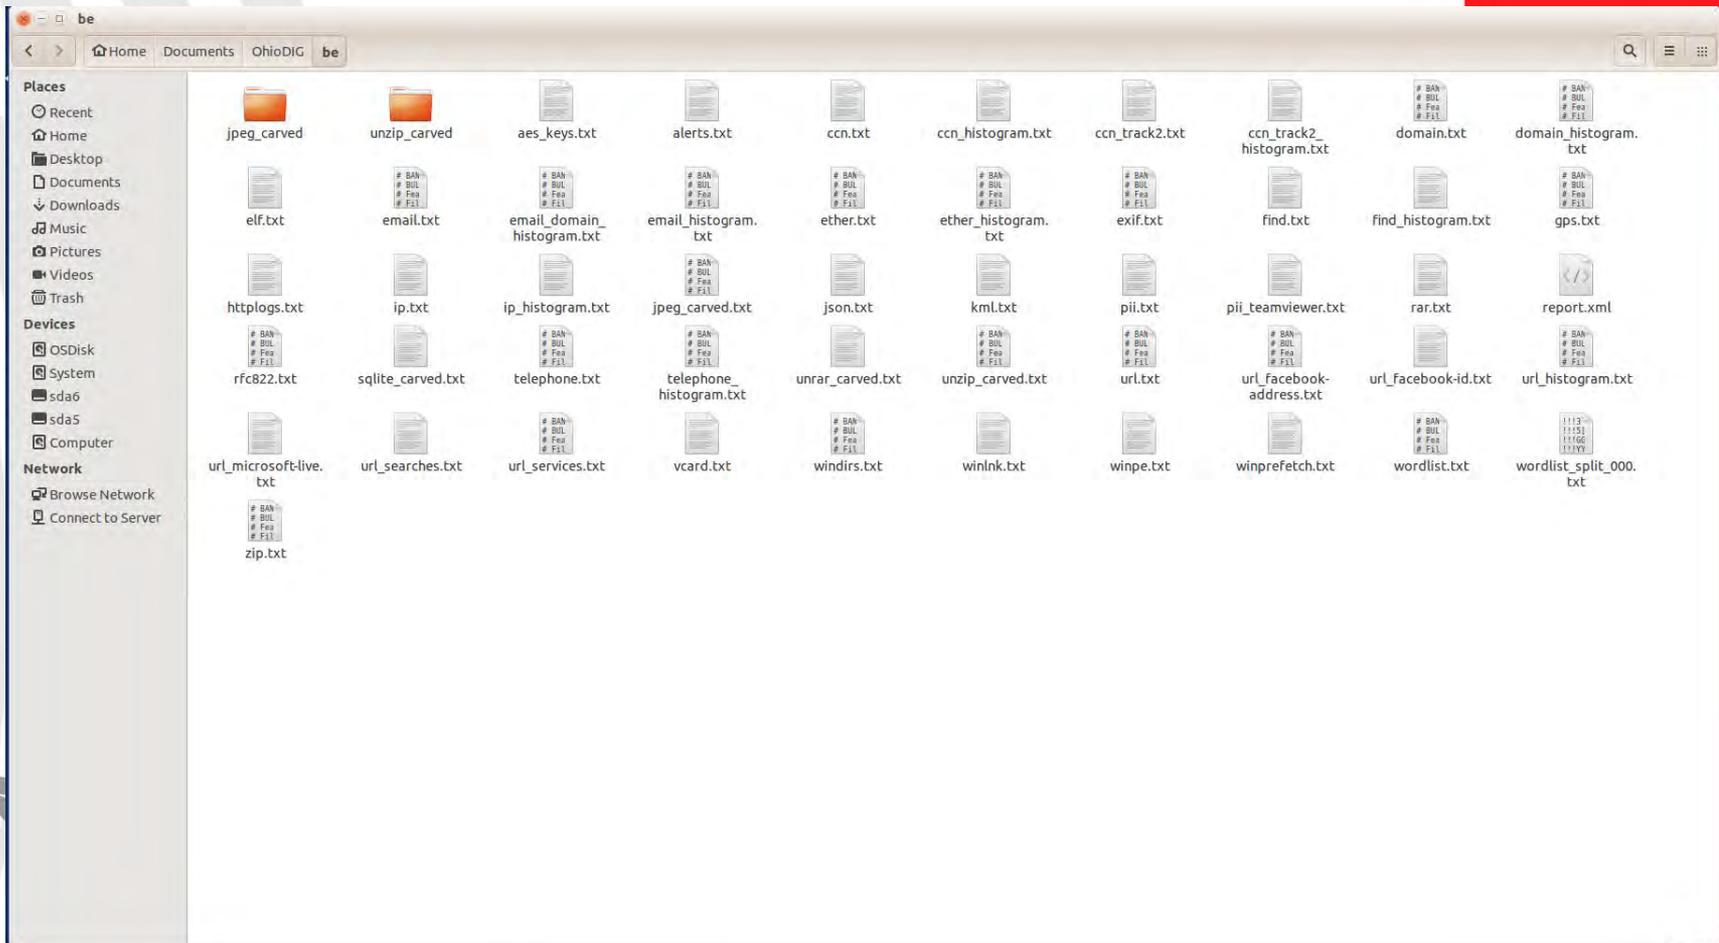

-The middle box is where you can select a list of keywords you want to flag

-The right column allows you to select pre-programmed "scanners" (e.g., credit card numbers, emails)

# Running Bulk Extractor

# Let's Explore These Files

# Looking Inside Flagged Files

What's happening here?

The items in bold in the left column represent scanners that found something.

The histogram shows how many files match an alert. This helps you establish rough idea of review time needed.

The screen on right shows which file has the matching word so you can determine whether to retain.
